Overview of U.S. Standards and Regulations

U.S. National Standards

The national standards governing electrical installations in the U.S.:

NOTE: UL 508A is both an application and a product standard.

Figure 1 - Standards

UL 508 to UL 60947-4-1

The standard for Industrial Control Equipment, UL 508, has been harmonized with the relevant product standards of the IEC standard for low-voltage control and automation, IEC 60947-4-1.

This harmonization work was undertaken with the intent of creating standards that, while being based upon and adopting IEC requirements, would incorporate sufficient national differences to ease the transition from UL 508 to UL 60947-4-1. This goal has largely been accomplished in most cases. While the UL 508 and UL 60947-4-1 standards do not look the same, when taking into account the national differences included in the harmonized standards, they are essentially technically identical.

Products originally listed to UL 508 will maintain their listing with no expiration. UL 508 and UL 60947-4-1 products can be used interchangeably.

The following industrial control categories are affected by this harmonization effort.

Table 1 - Industrial Control Categories

Standard	Product Description	Category Control Number
UL 60947-4-1	Magnetic Motor Controllers	NLDX
	Manual Motor Controllers	NLRV
	Combination Motor Controllers	NKJH
	Auxiliary Devices (Overload Relays only, Thermal & Electronic)	NKCR
	Industrial Control Switches	NRNT
UL 60947-5-1	Auxiliary Devices (Relays, Pilot Devices, Limit Switches)	NKCR

For more information on this transition, please refer to UL's website for *Industrial Control Equipment Transition to IEC Standards*.

Product Standards: UL 489 Circuit Breakers vs. UL 1077 Supplementary Protectors

UL 489 circuit breakers are used to protect feeder and branch circuits. UL 1077 supplementary protectors are intended for use as overcurrent protection within a piece of equipment where branch circuit overcurrent protection is already provided. UL 489 circuit breakers are required for compliance with NFPA 70 and NFPA 79.

UL 1077 supplementary protectors are redundant, or additional, protection on branch circuits for equipment. They complement other branch circuit protection, provided by either UL 489 circuit breakers or UL 248 fuses. UL 489 circuit breakers can be used in place of UL 1077 supplementary protectors, but UL 1077 supplementary protectors can never be used in place of UL 489 circuit breakers.

UL 1077 supplementary protectors are often called circuit breakers, but this is incorrect. Circuit breakers are listed to the UL 489 standard, while supplementary protectors are listed to the UL 1077 standard.

Certification Process

A nationally recognized testing laboratory (NRTL) can list or certify the equipment according to applications or product standards including the following: UL, CSA, ETL, and TUV. Other approved agencies are listed at the following website: <http://www.osha.gov/dts/otpc/nrtl/index.html#nrtls>.

Acceptance of Electrical Equipment in US

The process for acceptance is as follows:

1. The equipment is listed or the manufacturer is certified:
 - a. For mass production equipment, the industrial control panel itself is listed by an NRTL.
 - b. For custom or low-volume equipment, the manufacturer or supplier of the industrial control panel is certified.
2. A local inspector under the authority having jurisdiction (AHJ) inspects and approves the electrical equipment and the installation prior to commissioning. The product listing or labeling may be used to assist in the inspection.

Structure of a Motor Starter in Accordance with UL 508A

Feeder Circuit and Branch Circuits

The branch circuit consists of the last short-circuit protective device before a load and all power conductors and components between the last short-circuit protective device (SCPD) and the load.

The feeder circuit consists of all power conductors and components on the supply side of a branch circuit.

Figure 2 - Feeder Circuit and Branch Circuit

Table 2, page 7 contains a description of the numbered circuit components called out in the figure Feeder Circuit and Branch Circuit, page 7.

Table 2 - Circuit Components

7	Contactor or controller	20	Power transformer fuse—branch circuit protection
8	Starter	21	Power transformer—for motor load and control protector
9	Combination motor controller	22	Control circuit—Class 1 circuit—common control circuit
10	Branch circuit protection	23	Equipment ground and equipment ground terminal
11	Fused disconnect switch or circuit breaker	24	Bonding conductor—bonding jumper
12	Control transformer	25	Grounding electrode conductor terminal
13	Control transformer fuse or supplementary protection	26	Grounding electrode conductor—provided in the field

Disconnecting Means

A disconnect means is required for each incoming supply, and must open each ungrounded conductor of the supply circuit. A disconnect is also required for each controller and motor, and must be within line of sight of the controller and motor. However, it is permissible to use a single disconnect for a group of controllers. A single disconnect can also serve as the disconnect for both the motor and controller.

Disconnect Types

The following components are considered an acceptable means of disconnect for the feeder circuit:

- UL 489 inverse-time circuit breaker or molded case switch
- UL 98 switch unit, either open type or enclosed.

The following components are an acceptable means of disconnect in the branch circuit:

- UL 489 inverse-time circuit breaker, instantaneous trip circuit breaker (motor circuit protector (MCP)), or molded case switch
- UL 98 switch unit, either open type or enclosed
- UL 60947-4-1 disconnect or manual motor controller marked "Suitable as Motor Disconnect"
- Type E self-protected combination motor controller

Application of Disconnect Switches

There are two UL standards that govern disconnect switches: UL 98 and UL 60947-4-1 (formerly UL 508).

- UL 98 listed disconnects are suitable for both branch and feeder circuit applications.
- Disconnects listed to UL 60947-4-1 are intended for motor switching, and should only be used below the branch short-circuit protective device (SCPD).

See NEC 430 and UL 508A for additional requirements and exceptions.

Group Motor Installations

In a group motor installation, a single circuit breaker or fuse may be used for a group of motors. The specific rules are described in NEC Sections 430-112 and 430-53.

Group motor installations are used in the following applications:

- Fractional HP motors—NEC Section 430.53 (A):
- For several motors, each rated 1 HP maximum on a branch circuit of 1000 V maximum, a single SCPD not exceeding 15 A is permitted under the following circumstances:
 - No single motor is rated greater than 6 A Full Load Amperes (FLA).
 - The branch-circuit short-circuit device rating marked on any controller is not exceeded.
 - Appropriate motor overload protection is used. Refer to NEC Section 430.32.
- Smallest rated motor protected—NEC Section 430.53 (B):

The SCPD is sized for the motor in the group with the lowest rating.

- If the SCPD is a circuit breaker, it is sized to a maximum of 250% of the smallest motor FLA.
- If the SCPD is a time-delay fuse, it is sized to a maximum of 175% of the smallest motor FLA.

- If the SCPD is a non-time delay fuse, it is sized to a maximum of 300% of the smallest motor FLA.
- Other group installations—NEC Section 430.53 (C):

Two or more motors of any rating, or one or more motors and other loads, where all the following conditions are met:

 - Each motor controller and overload protection device carries a Motor Group Installation listing.
 - Each circuit breaker (if used) is listed and is of the inverse time type.
 - The SCPD is sized as follows:
 - If the SCPD is a circuit breaker, it is sized to a maximum of 250% of the largest motor FLA plus the sum of the full load current rating of all other motors and loads.
 - If the SCPD is a time-delay fuse, it is sized to a maximum of 175% of the largest motor FLA plus the sum of the full load current rating of all other motors and loads.
 - If the SCPD is a non-time delay fuse, it is sized to a maximum of 300% of the largest motor FLA plus the sum of the full load current rating of all other motors and loads.
 - Appropriate overcurrent protection is provided for non-motor loads.

Tap Conductor Sizing Rules

The tap conductor sizing rules for group motor installations are governed by NEC Section 430.53 (D). Conductors from the load side of the SCPD for the motor group must comply with one of the following:

- The ampacity is not less than that of the branch circuit conductors.
- The ampacity is not less than 1/3 of the branch circuit conductors, and the length from the point of the tap to the motor overload protection device is not more than 7.5 m (25 ft.).
- The ampacity is not less than 1/10 of the SCPD for the motor group, the length from the point of the tap to the controller(s) is not more than 3 m (10 ft.), and the manual motor controller is marked “Suitable for Tap Conductor Protection in Group Installations.”

NOTE: Products certified for motor grouping must carry the markings on the product label or instruction sheet required by NEC and UL (such as “Suitable for Tap Conductor Protection in Group Installations”).

For more information, see data bulletin 8502DB0701 entitled “Group Motor Installations: Understanding NEC 430.53 Requirements.”

Required Functions in Branch Circuits for a Motor Load

NEC 430 requires four essential functions in the branch circuit for a motor load. Each function plays an important role in the control and protection of the motor load. See the figure [Required Functions of Combination Starters](#) for the four functions that compose a complete motor branch circuit.

Figure 3 - Required Functions of Combination Starters

Combination Starter Construction Types

Combination Motor Controllers

A combination motor controller is a combination of devices that collectively possess the four required functions in a branch circuit for a motor load as defined by the NEC. A combination motor controller can be built using different component constructions, but must possess the essential four functions.

Combination motor controllers can consist of an open assembly or an enclosed assembly. Some combination motor controllers may be assembled in the field using components, while others may be required to be pre-assembled at the factory, depending on the combination construction type or the product.

Some combination construction types, but not all, are required by the NEC to be a listed combination. The UL 60947 standard governs the definition and approval requirements for combination motor controllers. See Table 3, page 12 to see which construction types the NEC requires to be listed.

When applying a listed combination motor controller, the components must be applied as stated in the listing, including specific part numbers and all conditions of acceptability.

Combination motor controllers listed to UL 60947-4-1 (formerly UL 508) can be located on the UL website at <https://industries.ul.com/industrial-systems-and-components/industrial-control-products-and-systems/short-circuit-current-ratings-for-combination-motor-controller-components>.

Combination motor controllers can be constructed using different short-circuit protection methods. Table 3, page 12 defines the various construction types, and identifies the construction types that are required by the NEC to be a listed combination.

Table 3 - UL Combination Starter Type Designations

	UL Combination Starter Type	Device Used for Component Function				
		Disconnect	Branch Circuit Protection	Motor Controller	Motor Overload Relay	
Traditional Combination Starters from the 1980s and Earlier	A	UL 98 Manual Disconnect	UL 248 Fuses	UL 60947 Magnetic or Solid-State Controller	UL 60947 Motor Overload Relay	 - UL 98 Disconnect Switch - UL 248 Fuses - UL 60947 Controller - UL 60947 Overload Relay  - UL 489 Circuit Breaker - UL 60947 Controller - UL 60947 Overload Relay
	C	UL 489 Inverse Time Circuit Breaker				
	D ¹	UL 489 Instantaneous Trip Circuit Breaker (Motor Circuit Protector)				
Introduced 1990	E ¹	UL 60947 Self-Protected Combination Controller				 - UL 60947 Type E Self-Protected Combination Starter: TeSys U  - UL 60947 Type E Manual Self-Protected Combination Starter: TeSys GV2P & GV3P
Introduced 2002	F ¹	UL 60947 Manual Self-Protected Combination Controller		UL 60947 Magnetic or Solid-State Controller	UL 60947 Manual Self-Protected Combination Controller	 UL 60947 Type F Combination Starter: TeSys GV2P/GV3P + TeSys D Contactor

Type A and C Construction

Types A and C combination motor controllers are traditional style starters that use either a listed disconnect switch and fuses or a listed circuit breaker as the disconnect means and short-circuit protection. Each type uses a separate UL 60947-4-1 (UL 508) listed motor controller and overload relay. These starters are evaluated by UL under the same set of short-circuit performance tests. Each type of combination starter clears detected faults without causing a fire or posing a risk of an electrical shock hazard to personnel. Each type is allowed to sustain damage that is contained within enclosures and may require the repair or replacement of devices after performing their protective function.

Branch circuits using fuses or circuit breakers are not required to be a part of a listed combination by the NEC. Thus design engineers may elect to apply circuit breakers, fuses, contactors, and overload relays based on their component UL ratings to build a branch circuit. However, a combination motor controller listing may be advantageous for customers to achieve a higher short-circuit current rating.

Circuit breakers offer an advantage over fuses in that they are resettable, and open all three phases during an overcurrent event.

1. The NEC requires this construction type be part of a listed combination (NEC 430.52)

Type D Construction

Type D combination motor controllers use a UL recognized instantaneous trip circuit breaker (also known as a motor circuit protector) as the means of disconnect and short-circuit protection. Motor circuit protectors differ from circuit breakers in that they are often magnetic only, and often include a dial to adjust the motor inrush sensitivity. Because motor circuit protectors do not possess the thermal overload protection, they must be properly paired with a motor starter. Thus the NEC requires that a branch circuit using a motor circuit protector must be applied per the same requirements as a listed combination motor controller.

Type D combination motor controllers are often used in applications where the motor may be a standard type or a high efficiency type, because the motor circuit protector provides adjustment ability for the inrush sensitivity.

The NEC requires that the motor circuit protector inrush setting be no more than 800% for standard motors or 1100% for high efficiency motors. If a motor trip occurs during start up, then the NEC allows the inrush setting to be set as high as 1300% for standard motors or 1700% for high efficiency motors. This requirement does not apply when the motor FLA is 8 amperes or less and when the continuous current rating of the motor circuit protector is 15 amperes or less.

When selecting a Type D combination motor controller, do not assume the prescribed motor circuit protector has the required motor inrush setting range required for code compliancy. Always verify that the inrush dial setting range is compliant for the application.

Type E Construction

The concept of a self-protected combination starter was introduced from Europe during the 1980s. This concept unveiled an integrated device that performed all the required functions of a combination motor controller in a single component.

The first self-protected combination starters were manual, but by the mid-1980s, electromechanical self-protected combination starters were also on the market. These starters cleared detected faults within their rating without sustaining damage and could be put back into operation.

UL introduced this concept in 1990 and added the Type E self-protected category for both manual and electromechanical combination starters. UL added a separate set of short-circuit and endurance performance tests just for the Type E self-protected category.

Type E combination motor controllers possess an advantage over the other construction types in that the combination motor controller must be able to be put back into operation after a short-circuit. Other construction types do not necessarily guarantee that the contactor or overload relay will not sustain any damage during a short circuit, and maintenance may be required to resume operation.

Type F Construction

Many Type E combination motor controllers are manually operated and require the addition of a contactor to permit signals from remote devices or a PLC to start or stop a motor. However, UL component ratings of contactors do not specify protection requirements using a Type E combination motor controller; rather, they only specify protection requirements using a circuit breaker or fuse. Thus UL addressed this by recognizing a Type F category in 2002. This combination consists of a self-protected combination motor controller and a contactor.

Type F combination motor controllers are advantageous in that they require less space compared to traditional constructions, while having a high short-circuit current rating.

Self-Protected Designation and Implications

A combination starter must pass certain performance tests specified by UL 60947-4-1 (formerly UL 508) before it can be designated as self-protected. The required test sequence for the Type E self-protected combination starters is listed in UL 60947-4-1, Table DVC.4.2.1.1.5. The test sequence includes both high fault and interrupting ability short-circuit (low fault) detection tests, followed by an endurance test.

The tests required for Types A through D and Type F combination starters are listed in UL 60947-4-1, Table DVC.4.2.1.1.4. This test sequence does not include the detection of low fault short-circuit tests followed by the endurance test. This is the difference between the testing and performance of a Type E self-protected combination starter and the other starter types.

Construction Type Selection

Panel designers may choose any of the six construction types for their motor control panel with each construction type offering different advantages.

Construction Types A through D all use the same motor controllers and overload relays. However, they feature different methods of performing disconnect and branch circuit protection functions:

- Type A is the only construction type that features fuses.
- Type B, which uses a UL 60947-4-1 (formerly UL 508) motor short-circuit protector, is no longer commercially available.
- Type C uses UL 489 inverse time circuit breakers.
- Type D uses UL 489 instantaneous trip circuit breakers.

The key distinction between Type A and Types C or D is whether a circuit breaker or fuse is used for branch circuit protection. A fuse is an overcurrent protection device with a circuit-opening fusible part that is heated and severed by the passage of overcurrent through it. A circuit breaker is a device designed to open and close a circuit by non-automatic means and to open the circuit automatically on a predetermined overcurrent without damage to itself when properly applied within its rating. The key difference between a fuse and a circuit breaker is that a fuse must be replaced once it experiences an overcurrent condition while a circuit breaker is resettable. Additionally, fuses operate independently on each phase while circuit breakers have three-phase common trip.

Construction Type E self-protected combination controllers and Type F combination controllers both offer the following advantages for panel designers:

- Higher coordinated short-circuit withstand ratings on UL 508A panels
- Easier component selection to meet the requirements of group motor applications
- Reduced panel space by reducing the number of components
- Required product markings to help designers quickly and accurately select components
- Increased productivity by reducing the number of wiring connections

UL 60947-4-1 Type E self-protected combination starters also offer the advantage of reliability. UL 60947-4-1's special endurance and short-circuit tests help ensure a coordinated combination starter that will clear a detected fault and protect itself from damage. It is the only category of combination starter that a designer can easily identify as self-protected due to the required "Self-Protected Combination Motor Controller" product marking.

Motor Starter Line Diagrams

Figure 4 - Power Supply Circuit

Code Requirements for Short-Circuit Current Ratings

The National Electrical Code, NFPA 79, and OSHA require proper short-circuit protection for control panels and industrial equipment. The following are some of the specific requirements regarding Short-Circuit Current Ratings (SCCRs):

- All control panels must be marked with its SCCR, using an approved evaluation method (such as UL 508A) (NEC 409.110).
- The available short-circuit current at the installation location of the control panel must be documented and available for inspection (NEC 409.22).
- Control panels must not be installed where the available short-circuit current exceeds its short-circuit current rating (NEC 409.22).
- Components intended to interrupt a short circuit must have a sufficient interrupting rating for the short-circuit current available at the line terminals (NEC 110.9, OSHA 1910.303(b)(4)).
- Components not intended to interrupt a short circuit must be properly paired with a short-circuit protection device so as not to create extensive damage during a short-circuit event (NEC 110.10, OSHA 1910.303(b)(5)).

Calculating the Available Short-Circuit Current

Determining the available short-circuit current requires information about the installation site. Information about the nearest upstream transformer and information about the conductors between the transformer and control panel are needed to make this calculation. Some of this information may be more difficult to attain, but conservative estimates can be applied to help define a conservative calculation of the available short-circuit current at the point of connection for the control panel.

To assist with this calculation, Schneider Electric has developed a fault current calculator available on the mySchneider app (located in "My Account"). After entering the installation site details, the fault current is calculated, and a system diagram and label can be sent via email.

Figure 5 - Calculating the fault current using the Fault Current Calculator on the mySchneider app

Determining the Short-Circuit Current Rating of the Control Panel

The SCCR of a control panel can be determined through testing the entire control panel assembly, or it can be determined using the method described in UL 508A Supplement SB.

NOTE: Using the interrupting rating of the main overcurrent protection device (OCPD) for the panel is not an acceptable practice.

WARNING

INADEQUATE SHORT CIRCUIT INTERRUPTING RATING

Do not use the interrupting rating of the main OCPD as the SCCR rating for the controller.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

UL 508A Supplement SB applies a weak link approach to determine the overall short-circuit current rating for the panel. With a few exceptions, the components in the power circuit are considered in the evaluation.

There are four basic steps to determine the control panel SCCR:

1. Determine the SCCR of each component.
2. Determine if the SCCR of a branch component can be raised using a current limiting device.
3. Determine the interrupting rating of all circuit breakers and fuses.
4. Choose the lowest interrupting rating or established component SCCR.

View a free webinar that explains how SCCR is determined for control panels in more detail using the links below:

- [Determining SCCR per UL 508A \(Part 1\)](#)
- [Determining SCCR per UL 508A \(Part 2\)](#)

See UL 508A for all requirements and exceptions regarding SCCR determination.

Determining the SCCR for Components

The SCCR of a component is determined by conducting a short-circuit test of the component using an overcurrent protection device. Devices that are not designed to interrupt a short-circuit (such as a contactor, overload relay, or power distribution block) must be properly paired with an overcurrent protection device (such as a circuit breaker or fuse), and tested to determine its SCCR value. Thus it is critical that these devices be applied with the proper overcurrent protection device to achieve a proper short-circuit current rating.

A device can achieve an SCCR in one of two methods:

- Testing a component per its UL standard to achieve a component SCCR (often referred to as High Fault)
- Testing a set of components together as a combination motor controller to achieve an SCCR for the combination

An SCCR can be applied to a device using either method. However, there are some differences between the two types:

Table 4 - Differences in the Two Methods for Testing Components

Component (High Fault) SCCR	Combination Motor Controller SCCR
• SCCR information is located on the product marking or in the instruction manual. • Often is more flexible regarding the required short-circuit protection, typically only limits to a maximum size • Applicable to feeder and branch circuits • Applicable to motors and other loads	• SCCR information is located on the UL web site at www.ul.com/sccr. • Specified part numbers must be used as prescribed. • Limited to branch circuits, motor loads only • Often has additional conditions of acceptability that must be observed, such as minimum enclosure volume or wire size • May achieve a higher SCCR than what can be obtained by the component ratings

A summary of short-circuit current ratings of common power circuit devices is provided in the following section of this document for the convenience of the reader.

In the event that an SCCR cannot be determined for a component, a default SCCR value is applied per UL 508A Supplement SB Table SB4.1. These SCCR values are often very low. Below are the default SCCR values for **common** component types:

- Motor Controllers (0–50 hp): 5 kA
- Motor Controllers (15–200 hp): 10 kA
- Non-GFC1 Receptacle: 10 kA
- Switch Unit: 5 kA
- Power Distribution Block: 10 kA
- Terminal Block: 10 kA
- Busbar: 10 kA

3. Switch and operating mechanism only. Does not include handle mechanism

4. 9422 R2 extends maximum mounting depth 7 inches.

5. Accommodates Class J fuses only.

6. Switches are fixed-depth or adjustable, depending on handle selection.

7. Commercially available enclosures may not accept 9422TG1 and two operating mechanisms. Contact the enclosure manufacturer for the availability of enclosures for use with these switches.

8. Right hand flange mounting only and requires a special enclosure.

9. Variable in increments of 0.63 inches.

LC1F2100	—	—	—	—	2100	—	—	—	—	—

NOTE: This table lists the maximum SCCR of the component when protected by any circuit breaker or fuse. If the maximum component SCCR is 65 kA and a 25 kA rated circuit breaker is used, then the system will be 25 kA, the SCCR rating of the circuit breaker.

²² Ratings apply to circuits with voltages no greater than those listed.

²³ The catalog numbers given are for 3-pole contactors. To obtain the 4-pole contactor catalog number, replace the * with a 4. The SCCRs for 3-pole and 4-pole contactors are identical.

Table 41 - TeSys NEMA Lighting Contactor Maximum Component SCCR⁶³

Catalog Number	Circuit Breakers @ 480 V ⁶⁴		Circuit Breakers @ 600 V ⁶⁴		Fuses @ 600 V ⁷⁰	
	Max. Size	Max. SCCR	Max. Size	Max. SCCR	Max. Size	Max. SCCR
	(A)	(kA)	(A)	(kA)	(A)	(kA)
LC1D25MEQ4096	60	85	60	50	60	100
LC1D40AMEQ4096	110	100	110	50	90	100
LC1D80MEQ4096	150	100	150	50	175	100

63. Ratings apply to circuits with voltages no greater than those listed.

64. When protected by any circuit breaker, including thermal-magnetic and magnetic-only.

65. When protected by any Class RK5, RK1, T, or J fuse.

66. When protected by any Class T or J fuse.

67. When protected by any circuit breaker meeting the size limits in Table 40, page 41.

68. When protected by any circuit breaker, including thermal-magnetic and magnetic-only, meeting the size limits in Table 40, page 41.

69. When protected by any Class J or CC time-delay fuse meeting the size limits in Table 40, page 41.

70. When protected by any Class J or CC time-delay fuse.

Table 41 - TeSys NEMA Lighting Contactor Maximum Component SCCR⁴¹ - (Continued)

Catalog Number	Circuit Breakers @ 480 V ⁷¹		Circuit Breakers @ 600 V ⁷¹		Fuses @ 600 V ⁷²	
	Max. Size (A)	Max. SCCR (kA)	Max. Size (A)	Max. SCCR (kA)	Max. Size (A)	Max. SCCR (kA)
LC1D150MEQ4096	250	100	250	50	300	100

NOTE: This table lists the maximum SCCR of the component when protected by any circuit breaker or fuse. If the maximum component SCCR is 100 kA and a 25 kA rated circuit breaker is used, then the system will be 25 kA, the SCCR rating of the circuit breaker.

98. The ID number is issued by Underwriters Laboratories and is shown on its website for UL 508A Listed combinations. For ID number definitions, see "Short Circuit Current Ratings for Combination Motor Controller Components" on the UL web site.

99. Use wire ties evenly spaced apart to secure conductors in place.

100. You must consider the need for cautionary labeling regarding high-fault short-circuit ratings in the end product application for Type D and E combination motor controllers.

101. All specified individual components of the combination motor controller have been installed in an enclosure having a specified internal volume in cubic inches. Additional testing in the combination motor controller is not required when installed in an enclosure.

102. See Table 52, page 51 for minimum internal wiring between the load side of the short-circuit protective device and the line side of starter.

103. Refer to the Digest to complete the contactor catalog number for coil voltage and form modifications.

104. ICB is Instantaneous Trip Circuit Breaker.

105. STR is an Electromechanical Motor Starter or Solid-State Motor Starter.

106. The ID number is issued by Underwriters Laboratories and is shown on its website for UL 508A Listed combinations. For ID number definitions, see "Short Circuit Current Ratings for Combination Motor Controller Components" on the UL web site.

107. Use wire ties evenly spaced apart to secure conductors in place.

108. You must consider the need for cautionary labeling regarding high-fault short-circuit ratings in the end product application for Type D and E combination motor controllers.

109. All specified individual components of the combination motor controller have been installed in an enclosure having a specified internal volume in cubic inches. Additional testing in the combination motor controller is not required when installed in an enclosure.

110. See Table 52, page 51 for minimum internal wiring between the load side of the short-circuit protective device and the line side of starter.

111. Refer to the Digest to complete the contactor catalog number for coil voltage and form modifications.

112. Ratings apply to circuits with voltages no greater than those listed.

113. When protected by any circuit breaker, including thermal-magnetic and magnetic-only.

114. When protected by any Class RK5, RK1, T, or J fuse.

115. When protected by any Class T or J fuse.

Table 51 - Type S Starters with Motor Logic or TeSys T Overload Relays Max. Component SCCR⁵¹ - (Continued)

Catalog Number	Circuit Breakers @ 480 V ¹¹⁶		Fuses @ 600 V	
	Max. Size (A)	Max. SCCR (kA)	Max. Size (A)	Max. SCCR (kA)

TeSys™ GV4PB + TeSys D

Figure 42 - Two-Component Motor Circuit Solution (up to 115 A)

The TeSys GV4PB Motor Protection Circuit Breaker combines the functionality of a circuit breaker and an overload relay in a single device. Approved to UL 489, the TeSys GV4PB is suitable for use as a branch short-circuit protection device, and can be paired with any contactor to build a complete branch circuit for a motor load.

The TeSys GV4PB includes an advanced trip unit with additional protections that can be adjusted to provide the best protection for the application. A pre-trip alarm is also available with the use of the SDx module, providing notification that can be used to initiate proactive measures to avoid downtime or to alert operators of an issue.

Table 59 - Two-Component Motor Circuit Solution with IEC Motor Control

Short-Circuit Protection, Disconnect, and Overload Protection			+	Motor Controller	
GV4PB Reference	Motor FLA Dial Range	UL 489 Interrupting Rating @ 480 Y		TeSys D Suggested Reference	SCCR @ 480 Y with shown GV4PB ¹²⁵

Specific Requirements for the Canadian Market

Installation and Product Standards

The installation standard in Canada is the *Canadian Electrical Code* (CEC). The CEC and the NEC are similar, but not 100% equivalent.

The same is true for the CSA standards and corresponding UL standards (see Table 67, page 75). Some of the major differences are detailed below.

Certification Process

As in the U.S., nationally recognized testing laboratories (such as: CSA, ETL, TUV, and UL) are able to certify equipment according to these CSA standards. Refer to *Acceptance of Electrical Equipment in US*, page 6.

Technical Differences between Canadian and U.S. Standards

Some examples of differences between the Canadian and U.S. standards that currently apply to motor starters are listed in Table 67, page 75. The TeSys™ product line is designed for compliance and compatibility with both the UL and the CSA requirements.

- Type E and Type F applications do not require the use of large spacing adapters when used in Canada.
- Group installation is recognized but the rules to define the common branch-circuit protection setting is quite different.
- Industrial control panels must meet CSA C22.2 No. 14.
- Elevator equipment appliances must comply with the specific CSA Nr. B44.1 standard.
- Product marking requirements differ slightly.

Table 68 - Comparison of CSA and UL Standards

Standard Name	CSA Standard	UL Standard
Enclosed and Dead-Front Switches	CSA C22.2 No. 4	UL 98
Low-Voltage Fuses: Part 1: General Requirements	CSA C22.2 No. 248	UL 248
Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit-Breaker Enclosures	CSA C22.2 No. 5	UL 489
Industrial Control Equipment	CSA C22.2 No. 14	UL 60947
Elevator Equipment	CSA No. B44.1	Partially UL 60947

Full-Load Current, Three-Phase Alternating-Current Motors

The full-load currents in Table 68, page 76 are based on the 2017 National Electrical Code, Table 430.250. These value are indicative; they vary according to the type of motor, the number of poles, and the manufacturer.

Table 69 - Induction-Type Squirrel Cage and Wound Rotor (A)

Horsepower (HP)	115 V	200 V	208 V	230 V	460 V	575 V
